```
 1    When you install the sample applications, an attempt is made to create a
 2   user account ("adcdemo") within SQL Server. If this account already exists,
 3   the installation will succeed; however, when you run the sample application
 4   you may receive a "login failed" message. You can edit the sample files to
 5   set the username and password to a working account.
 6   Using FoxPro Databases
 7  If you access Visual FoxPro data, you must use the latest Visual FoxPro ODBC driver   ↙
        (version 5.0.0.402 or later), which is available from http://www.microsoft.com/   ↙
        vfoxpro/vfdownload. If you don't use the latest driver, you may not be able to    ↙
        execute queries correctly.
 8
 9   "System error: out of virtual memory" Error
10  If you receive the error, "System error: out of virtual memory" from the Web Server,  ↙
        requiring a reboot, the following may address the error. Your Web server machine   ↙
        might be out of virtual memory, or the SQL data source server might require more   ↙
        TempDB space to handle the size of the query you are attempting to run. Virtual    ↙
        memory can be adjusted from Control Panel. (Click the System icon, select the      ↙
        Performance tab, and click the Virtual Memory button to see if there is extra hard ↙
        disk space available.) More information on how to adjust the TempDB space can be   ↙
        found in the the "Performance" Help topic's subtopic, "Ensuring Sufficient TempDB  ↙
        Space."
11
12  The following is a list of Remote Data Service 1.1 known problems.
13
14   Version 1.0.0.806 of the Visual Basic Script DLL (vbscript.dll) contains a memory leak↙
        . An updated version of the DLL (2.0.0.1114 or later) resolves the issue. It is    ↙
        available with Internet Information Server 3.0 and can be downloaded from http://  ↙
        www.microsoft.com/vbscript.
15
16   When you use RDS with the Visual Basic 5.0 list box or combo box control in Internet  ↙
        Explorer version 4.0, you should set the ListField property for the list box or    ↙
        combo box control at design time in the control's <OBJECT> tags. Otherwise, if you ↙
        set the ListField property at run time in VBScript code, the data won't be         ↙
        populated in the controls. Therefore, you should use HTML code like the following:
17  instead of VBScript code like:
18
19
20
21   If you make changes to data on your RDS page and then go to another page without      ↙
        canceling or submitting the changes, when you return to your RDS page, you might    ↙
        get an "Unexpected Error" message. Calling the RDS.DataControl object's Refresh     ↙
        method when you return to the page will resolve this problem.
22
23   When loading the sample pages for the first time on some machines with Microsoft      ↙
        Internet Explorer version 3.02, an object may not load or you may receive an        ↙
        "Unexpected Error (0x80020009)" message. If this happens, click the "Refresh"       ↙
        button to correct the problem.
